Delivering championship fairways and greens

Spray before major summer holidays for optimal conditions

For cool-season courses, summer is the most challenging time of year. Superintendents have to contend with the heat, humidity and heavy play that increases disease pressure and tests the resilience of turfgrass.

“When turf is healthy, it rebounds faster from stressors, whether it’s summer weather, traffic or aeration,”

says Kyle Miller, BASF Market Development Specialist. “To enhance turf health, it’s important to be proactive and implement a summer spray program.”

The holiday spray program from BASF is designed to protect cool-season greens, fairways and tees from summer stress with spray applications before each major holiday.

The foundation of the holiday spray program is **Intrinsic**® brand fungicides, which deliver broad-spectrum control of 27 diseases with up to 28 days of residual control. **Intrinsic** brand fungicides also provide essential plant health benefits, enhancing growth efficiency for longer, stronger roots and improving recovery time from stressors.

Holiday spray recommendations for cool-season turf

- Spray **Lexicon**® **Intrinsic** brand fungicide before Memorial Day, July 4th and Labor Day for healthy greens.
- Spray **Insignia**® **SC Intrinsic** brand fungicide or Honor Intrinsic brand fungicide before Memorial Day, July 4th and Labor Day for healthy fairways, tees and surrounds.

“**Intrinsic** brand fungicides control the most troublesome, invasive summer diseases, like dollar spot and summer patch,” says Miller. “It’s important to get ahead of disease pressure with regular applications of these innovative fungicides.”

For championship conditions throughout the stress of summer, follow the holiday spray program recommendations for your cool-season turf.

Always read and follow label directions.
